As science crafts detailed accounts of human nature, what has become of the soul? This collaborative project strives for greater consonance between contemporary science and Christian faith. Outstanding scholars in biology, genetics, neuroscience, cognitive science, philosophy, theology, biblical studies, and ethics join here to offer contemporary accounts of human nature consistent with Christian teaching. Their central theme is a nondualistic account of the human person that does not consider the "soul" an entity separable from the body; scientific statements about the physical nature of human beings are about exactly the same entity as are theological statements concerning the spiritual nature of human beings. For all those interested in fundamental questions of human identity posed by the present context, this volume will provide a fascinating and authoritative resource.

Fifty years ago the field of human embryology was incomplete; prior to that time the anatomy of early human embryos was still unknown, and there was much to be learned about the older stages of human embryonic development. It is now understood that human organs result from step-by-step differentiations of the growing human embryo. Research by renowned embryologist Erich Blechschmidt, MD, showed that differentiations are not only the result of a gene effect, but are also brought about through growth initiated by extragenetic (occurring outside the gene) information.

Without this extragenetic information the differentiation would not begin. Dr. Blechschmidt and coauthor Raymond Gasser, PhD, maintain that Haeckel's biogenetic law (ontogeny recapitulates phylogeny) was an erroneous attempt to explain developmental processes. Blechschmidt's human embryological investigations showed that Darwin's principles (mutation and selection) are likely valid for the origin of the species, but that they cannot explain the ontogenesis of the organs. The ontogenesis of each individual cannot be derived from phylogenetic facts. The authors stress that a clear distinction must be made between the vast field of phylogenetics and the much more exact and understandable field of ontogenetics—particularly the process of differentiation—and their goal is to present not only the abstract biokinetic principles of differentiation, but the originality of embryonic human beings as well. Their knowledge of developmental movements leads to their conclusion that differentiation is an undivided biodynamic process that occurs during development and includes the chemical processes as well. Logically organized into two sections (the first covers early metabolic fields and includes chapters on the one-cell human ovum, the early embryo, blood vessels, the nervous system, head region, trunk, and limbs; the second describes metabolic fields in later developmental stages, distinguishing fields of corrosion, densation, contusion, distusion, retention, dilation, liquation, and detracton), Biokinetics and Biodynamics of Human Differentiation warrants reading by thoughtful professionals in a number of fields concerned with embryonic differentiation. A new preface by Dr. Gasser addresses how the book's principles and findings were and are understood in the field of human embryology.

A study of the word pair "action and reaction" embracing philosophy, semantics, literature, and science. What do biologists mean when they say that to live is to react? Why was the term *abreaction* invented and later abandoned by the first generation of psychoanalysts? What is meant by *reactionary politics*? These are but a few of the questions the internationally renowned scholar Jean Starobinski answers in his conceptual history of the word pair, *action and reaction*. Not simply a history of ideas, *Action and Reaction* is also a semantic and philological history, a literary history, a history of medicine, and a history of the biological sciences. By concentrating on the moment when scientific language and ordinary language diverge, Starobinski uncovers a genealogy of the human and natural sciences through their usage of *action and reaction* as metaphors. Newton's law--to every action there is an equal and opposite reaction--becomes a point of departure for an exploration of the lexical and metaphorical traces left in its wake. Starobinski analyzes the scientific, literary, and political effects of the use of the terms *action and reaction* to describe and explain the material universe, the living body, historical events, and psychological behavior. In what he calls a "polyphonic score"--a kind of mosaic--he uses his subject to offer new insights into the work of philosophers (Aristotle, Leibniz, Kant, Nietzsche, Jaspers), scientists (Newton, Bichat, Bernard, Bernheim, Freud), and writers (Diderot, Constant, Balzac, Poe, Valry). Ultimately, the book explores the power and danger of metaphorical language and questions the convergence and collapse of scientific and moral explanations of the universe.
