Modern Orthodox theology represents a continuity of the Eastern Christian theological tradition stretching back to the early Church and especially to the Ancient Fathers of the Church. This volume considers the full range of modern Orthodox theology. The first chapters of the book offer a chronological study of the development of modern Orthodox theology, beginning with a survey of Orthodox theology from the fall of Constantinople in 1453 until the early 19th century. Ladouceur then focuses on theology in imperial Russia, the Russian religious renaissance at the beginning of the 20th century, and the origins and nature of neopatristic theology, as well as the new theology in Greece and Romania, and tradition and the restoration of patristic thought. Subsequent chapters examine specific major themes: - God and Creation - Divine-humanity, personhood and human rights - The Church of Christ - Ecumenical theology and religious diversity - The 'Christification' of life - Social and Political Theology - The 'Name-of-God' conflict - The ordination of women The volume concludes with assessments of major approaches of modern Orthodox theology and reflections on the current status and future of Orthodox theology. The development of science, according to respected scholars Peter J. Bowler and Iwan Rhys Morus, expands our knowledge and control of the world in ways that affect-but are also affected by-society and culture. In *Making Modern Science*, a text designed for introductory college courses in the history of science and as a single-volume introduction for the general reader, Bowler and Morus explore both the history of science itself and its influence on modern thought. Opening with an introduction that explains developments in the history of science over the last three decades and the controversies these initiatives have engendered, the book then proceeds in two parts. The first section considers key episodes in the development of modern science, including the Scientific Revolution and individual accomplishments in geology, physics, and biology. The second section is an analysis of the most important themes stemming from the social relations of science-the discoveries that force society to rethink its religious, moral, or philosophical values. *Making Modern Science* thus chronicles all major developments in scientific thinking, from the revolutionary ideas of the seventeenth century to the contemporary issues of evolutionism, genetics, nuclear physics, and modern cosmology. Written by seasoned historians, this book will encourage students to see the history of science not as a series of names and dates but as an interconnected and complex web of relationships between science and modern society. The first survey of its kind, *Making Modern Science* is a much-needed and accessible introduction to the history of science, engagingly written for undergraduates and curious readers alike.

The mystery of Earth's invisible, life-supporting power Alanna Mitchell's globe-trotting history of the science of electromagnetism and the Earth's magnetic field--right up to the latest indications that the North and South Poles may soon reverse, with apocalyptic results--will soon change the way you think about our planet. Award-winning journalist Alanna Mitchell's science storytelling introduce intriguing characters--from the thirteenth-century French investigations into magnetism and the Victorian-era discover that electricity and magnetism emerge from the same fundamental force to the latest research. No one has ever told so eloquently how the Earth itself came to be seen as a magnet, spinning in space with two poles, and that those poles have dramatically reversed many time, often coinciding with mass extinctions. The most recent reversal was 780,000 years ago. Mitchell explores indications that the Earth's magnetic force field is decaying faster than previously thought. When the poles switch, a process that takes many years, the Earth is unprotected from solar radiation storms that would, among other disturbances, wipe out much and possible all of our electromagnetic technology. Navigation for all kinds of animals is disrupted without a stable, magnetic North Pole. But can you imagine no satellites, no Internet, no smartphones--maybe no power grids at all? Alanna Mitchell offers a beautifully crafted narrative history of surprising ideas and science, illuminating invisible parts of our own planet that are constantly changing around us.

Good graphs make complex problems clear. From the weather forecast to the Dow Jones average, graphs are so ubiquitous today that it is hard to imagine a world without them. Yet they are a modern invention. This book is the first to comprehensively plot humankind's fascinating efforts to visualize data, from a key seventeenth-century precursor--England's plague-driven initiative to register vital statistics--right up to the latest advances. In a highly readable, richly illustrated story of invention and inventor that mixes science and politics, intrigue and scandal, revolution and shopping, Howard Wainer validates Thoreau's observation that circumstantial evidence can be quite convincing, as when you find a trout in the milk. The story really begins with the eighteenth-century origins of the art, logic, and methods of data display, which emerged, full-grown, in William Playfair's landmark 1786 trade atlas of England and Wales. The remarkable Scot singlehandedly popularized the atheoretical plotting of data to reveal suggestive patterns--an achievement that foretold the graphic explosion of the nineteenth century, with atlases published across the observational sciences as the language of science moved from words to pictures. Next come succinct chapters illustrating the uses and abuses of this marvelous invention more recently, from a murder trial in Connecticut to the Vietnam War's effect on college admissions. Finally Wainer examines the great twentieth-century polymath John Wilder Tukey's vision of future graphic displays and the resultant methods--methods poised to help us make sense of the torrent of data in our information-laden world.

Nationalism, War and Jewish Education explores historical circumstances leading to the emergence of a Jewish religious school system lasting to modern times and the process by which this system was broken down and adapted in secular form as Jewish nationalism grew in the 19th and early 20th centuries. In the Roman period, education became an essential part of rabbinic pacifist accommodation following Jewish defeats, while in the modern period, secular education was associated with nationalism and increasing militancy of emerging states. In both periods there was a revival of Hebrew and the creation of an educational system based on Hebrew texts. Both revivals were responses to anti-Semitism, which pushed large numbers of Jews

away from assimilation into the dominant culture to a renewed Jewish national identity. The book highlights the centrifugal and centripetal shifts in Jewish identity, from messianic militarism to pacifism and back. It shows how changes in Jewish education accompanied these shifts. While drawing on historical scholarship for background, this book is essentially a literary study, showing how literary changes at different times and places reflect historical, socio-psychological, economic and political change. Nationalism, War and Jewish Education is original in showing how ancient Jewish education affected modern Jewish society, therefore it is a valuable resource for students and researchers interested in Jewish history and literature, education, development studies and nationalism.

*Earth's Evolving Systems: The History of Planet Earth* is intended as an introductory text that examines the evolution of the Earth and its life from a systems point of view. The text covers major topics like the lithosphere, hydrosphere, atmosphere, and biosphere, and discusses how these systems interacted with each other and evolved through geologic time. The author takes care to integrate the current state of our Earth systems with those of the past in an effort to develop students' interests in Earth system in general. It begins by examining the basics of Earth systems, including discussions of sedimentation, evolution, stratigraphy, and plate tectonics. Part Two looks at the beginning of time with the origin of the Earth and discusses its early evolution, through the origin of life and its evolution to multicellularity. The third section goes on to cover the Paleozoic through the Neogene eras, discussing topics such as tectonics, mountain building, sea level, climate, life, and mass extinctions in each era. The final part moves on to the modern world, discussing the interactions between humans and Earth systems, with an emphasis on the climatic system. Key Features of Earth's Evolving System: - Presents the Earth as a continuously evolving and dynamic planet

whose history consists of a succession of vastly different worlds very much unlike our modern Earth. - Discusses the scientific method in Chapter 1, emphasizing how historical geology differs from the standard "scientific method" presented as the paradigm of experimental sciences and of all science. - Bridges traditional historical geology texts by discussing historical information in the context of the interaction and integration of Earth systems through geologic time by using the tectonic (Wilson) cycle as a unifying theme. - Concentrates on North America but offers a global perspective on Earth systems on processes such as orogenesis, seaways, and ocean circulation, the evolution of life, and mass extinction. - Discusses rapid climate change and anthropogenic impacts in the context of a continuously evolving Earth whose environments are now being altered by anthropogenic climate change. - End-of-chapter materials include: general review questions, more challenging "Food for Thought" questions, key terms listing, and a "Sources and Further Readings" section. - Boxes throughout the text highlight interesting bits of related information, unusual occurrences, or elaborates on material presented in the text

In this fourth edition Neal Riemer and Douglas W. Simon again

seek to introduce students to the challenging discipline of political science by highlighting six cardinal features. The editors strongly believe that their unique and comprehensive approach, employing those six features, can best equip students of political science to stay abreast of the ever-changing, and ever-challenging, world of politics. First and most important Riemer and Simon affirm the importance of addressing the three main concerns of political science: political and philosophy and ethics, empirical/behavioral political science, and public policy. Second, the authors reaffirm their normative preference for politics as a civilizing enterprise, one that enables people in the political community live better, to grow robustly in mind and spirit, and to find creative fulfillment. The fourth cardinal feature requires to recognize realistically the ever-changing nature of politics and the tasks of assessing and responding to changing values. The sixth cardinal feature of *The New World of Politics* is understanding the importance of keeping the future in mind--not only the immediate future, but the long-range future. This book seeks to introduce students to political science as a discipline intimately involved with ethics, empirical social scientific inquiry, and public policy. Neal Riemer and Douglas W. Simon are endeavoring to help students respond to those future problems with understanding and wisdom. A Collegiate Press book
