Here, typically a system, as cylinder of gas, initially in its own state of internal thermodynamic equilibrium, is set out of balance via heat input from a combustion reaction. Equilibrium thermodynamics - Wikipedia Thermodynamic equilibrium is an axiomatic concept of thermodynamics. It is an internal state of a single thermodynamic system, or a relation between several thermodynamic systems connected by more or less permeable or impermeable walls. In thermodynamic equilibrium there are no net macroscopic flows of matter or of energy, either within a system or between systems. In a system that is in its own state of internal thermodynamic equilibrium, no macroscopic change occurs. Systems in mutual thermody Thermodynamic equilibrium - Wikipedia Thermodynamics the study of the transformations of energy from one form into another First Law: Heat and Work are both forms of Energy. in any process, Energy can be changed from one form to another (including heat and work), but it is never created or destroyed: Conservation of Energy Thermodynamics - Texas A&M University The first law of thermodynamics is often quoted in the form \Heat is a form of energy (as is work) and energy is conserved.". This is a perfectly respectable statement, and is the one given by Feynman. However, Adkins in section 3.2 gives a somewhat diferent statement.
