Covering the functional and esthetic needs of edentulous patients, *Prosthodontic Treatment for Edentulous Patients: Complete Dentures and Implant-Supported Protheses*, 13th Edition helps you provide complete dentures, with and without dental implant support. It addresses both the behavioral and clinical aspects of diagnosis and treatment and covers treatment modalities including osseointegration, overdentures, implant-supported fixed prosthesis, and the current and future directions of implant prosthodontics. New to this edition are full-color photographs and coverage of immediately loaded complete dental protheses. From lead editor and respected educator George Zarb, *Prosthodontic Treatment for Edentulous Patients* provides an atlas of clinical procedures and emphasizes the importance of evidence-based treatment. Short, easy-to-read chapters cover the essentials of care for both short- and long-term patients, stressing the importance of evidence-based treatment. Expanded coverage of implant prosthodontics addresses the clinical protocols for implant-retained and implant-supported prosthodontic management. Specific chapters address the three surfaces of the complete denture: (1) an impression or intaglio surface, (2) a polished surface, and (3) an occlusal surface, the integration of which is crucial to creating a stable, functional, and esthetic result. Chapter on health and nutrition examines a number of systemic conditions (vesciculoerosive conditions, systemic lupus erythematosus, burning mouth syndrome, salivary dysfunction, Sjögren's syndrome, hyper/hyposalivation, diabetes) that affect the oral cavity and specifically influence the prognosis for wearing complete dentures or for accepting osseointegrated protheses. Chapter on the time-dependent changes which occur in the oral cavity focuses on both time-related direct (ulcer/cheek biting, irritation hyperplasia, denture stomatitis, flabby ridge and pendulous maxillary tuberosities, hyperkeratosis and oral cancer, residual ridge reduction) and indirect (atrophy of masticatory muscles, nutritional status and masticatory function, control of sequelae) changes in the oral environment, and provides strategies to minimize the risk of such changes. Chapter on the techniques used to prolong the life of complete dentures focuses on the two techniques used to extend the life of dentures: relining and rebasing, also touching on denture duplication. Well-respected editors and contributors are the leaders in their field, lending credibility and experience to each topic.

The journey towards successful denture fabrication begins with making accurate impressions. All subsequent steps that are necessary for complete denture fabrication will be greatly diminished if the denture base does not fit due to inadequate impression. Impression making consumes a significant portion of the dentist's time during denture construction. Therefore a good impression will help to insure that complete denture is stable, retentive and comfortable. So, the knowledge of different impression techniques are very important for us to achieve a good impression.

This book presents the fundamentals of removable denture prosthodontics and the Biofunctional Prosthetic System (BPS) in an easy-to-learn clinical technique. Dr Abe explains, step-by-step, how to fabricate a BPS denture and then outlines the procedure necessary for fabrication of suction-effective dentures, which includes a new approach to impression taking that uses a frame cut-back tray to record the specific anatomical features of dental soft tissue and the underlying bony structures and therefore allows more reliable denture fabrication and better suction of the denture. Included are discussions related to the management of difficult cases of total edentulism in both the maxilla and mandible and the esthetic enhancement of the patient. A great resource for any prosthodontist.

Complete Denture Prosthodontics John Wiley & Sons

Abstract: Conventional methods of complete denture (CD) fabrication involve multiple and complex clinical and laboratory procedures. With the introduction of CAD/CAM fabricated CDs, these techniques seek to ameliorate the potential disadvantages associated with conventional complete denture fabrication and highlight potential advantages such as reduced number of patient visits and improved fit of the prostheses. However, comprehensive clinical data on CAD/CAM complete dentures, that conform to an evidence based approach, are severely lacking in the available literature. To date, there are few, if any, randomized clinical trials or retrospective analyses evaluating the clinical performance and behavior of CAD/CAM fabricated dentures. In this study, patients who received CAD/CAM fabricated CDs (AvaDent® Global Dental Science LLC, Scottsdale, Ariz.) at The Ohio State University College of Dentistry were identified. Using a dental software search tool (Windent EE; Carestream Dental), the total number of CAD/CAM fabricated CDs treated within the Pre-doctoral Comprehensive Care Clinics, Advanced Prosthodontics Clinic and Dental Faculty Practice Clinic between the years 2012 and 2014 were identified. Retrospectively, data were collected from these charts of patients. Data were collected from the reviewed charts to identify and assess objective and subjective treatment outcomes including: number of appointments needed to deliver the final complete denture prostheses, number of post delivery adjustments needed due to presence of sore spots, and the reported complications with these prostheses such as compromised denture retention, fractures, incorrect vertical dimension of occlusion and/or incorrect centric relation. It was also determined whether the experience level of the operator had an influence on the number of appointments needed to deliver the final prosthesis and in the total amount of complications observed. In addition, a 13-item questionnaire was sent in the mail to those patients included in this study, in order to determine overall patient satisfaction with questions referencing their current complete denture experience. A total of fifty patients were included in this study (25 female and 25 male) between the ages of 26-90 with a mean of 62.64 years of age. The mean number of appointments needed to deliver the prosthesis in all operator experience categories (PRED, GRPR, DFP) was 2.38 compared to the control number of appointments claimed by the company as 2. In regard to post insertion adjustment visits, the mean number for the fifty patients treated was 2.12. Of the 94 arches completed, 23 prosthesis could not be delivered at the second appointment. For this, the most common reported reason were lack of retention (9/23) and incorrect vertical dimension of occlusion (4/23). All 23 dentures not delivered in the second appointment were delivered at the third appointment. No significant differences were found for number of appointments needed to deliver the prostheses in relation to operator experience. No differences were found for occurrence of a complication versus the level of operator experience. In regard to the survey component of this study, out of the 19 patients who participated, 14 of those were experienced denture wearers and it was concluded that this group, a significant difference could not be demonstrated in their ratings of agreement regarding the digital complete dentures being better

than their conventional set. This data could suggest, as the company claims, that this is a cost-effective treatment modality and proves beneficial for both the clinician and patient as the number of appointments needed to deliver these dentures was considerably less than those fabricated the conventional way, thus potentially enhancing productivity. This outcome, in turn, could translate into reduced chair time and cost burden to the clinician without compromising the quality of the overall treatment.
