Although aviation is among the safest modes of transportation in the world today, accidents still happen. In order to further reduce accidents and improve safety, proactive approaches must be adopted by the aviation community. The International Civil Aviation Organization (ICAO) has mandated that all of its member states implement Safety Management System (SMS) programs in their aviation industries. While some countries (the United States, Australia, Canada, members of the European Union and New Zealand, for example) have been engaged in SMS for a few years, it is still non-existent in many other countries. This unique and comprehensive book has been designed as a textbook for the student of aviation safety, and as an invaluable reference tool for the SMS practitioner in any segment of aviation. It discusses the quality management underpinnings of SMS, the four components, risk management, reliability engineering, SMS implementation, and the scientific rigor that must be designed into proactive safety. The authors introduce a hypothetical airline-oriented safety scenario at the beginning of the book and conclude it at the end, engaging the reader and adding interest to the text. To enhance the practical application of the material, the book also features numerous SMS in Practice commentaries by some of the most respected names in aviation safety. In this second edition of Safety Management Systems in Aviation, the authors have extensively updated relevant sections to reflect developments since the original book of 2008. New sections include: a brief history of FAA initiatives to establish SMS, data-driven safety studies, developing a system description, SMS in a flight school, and measuring SMS effectiveness.

This document, which is based on information from March 2007, provides an overview of Electronic Flight Bag (EFB) systems and capabilities, with particular focus on the systems' human interface. It updates the April 2005 EFB Industry Review (Yeh and Chandra, 2005). The information in this document will be useful to anyone interested in the EFB market, including the Federal Aviation Administration (FAA), customers, operators, manufacturers, and researchers. The report is divided into three sections. The first section briefly reviews EFB research conducted by the Volpe Center over the past several years and the results of that research. The second section describes products and services offered by several system providers and integrators. The third section is a list of software providers. A list of references, including policy and research documents is provided at the end of this report.

The Natural Radiation Environment Symposium (NRE VII), the Seventh in the NRE series, which commenced forty years ago in 1963 at Rice University Texas, was held in Rhodes (Greece) in May 2002. During the intervening four decades the research work presented at these NRE Symposia has contributed to a deeper understanding of natural radiation and in particular of its contribution to human radiation exposures. It is clear from the quality and diversity of the 143 papers in this volume of Radioactivity in the Environment series that the study of the natural radiation environment is an active and continually expanding field of research. The papers in this volume fall into a number of main and topical research areas namely: the measurement and behaviour of natural radionuclides in the environment cosmic radiation measurement and dosimetry the external penetrating radiation field at ground level TENR (Technologically Enhanced Natural Radiation) and NORM (Naturally Occurring Radioactive Materials) studies assessment of the health effects of radon regulatory aspects of natural radiation exposures In these papers the results of many new surveys of natural radionuclide levels in the environment and of improved methods of detection are described. While some of the natural radiation sources investigated are unmodified by human activity, many accounts are given here of exposures to natural sources which have been enhanced by technology. Such TENR and NORM exposures are shown to range from activities such as mining, oil and gas exploitation, the use of industrial by-

products as building materials, to space travel to name but a few. In several cases quite high doses to some individuals are shown to occur. Accounts are given here of methods to prevent and reduce exposures to such sources.

The worldwide expansion in the development and use of unmanned aircraft systems (UAS) has rapidly spawned a patchwork of regulatory initiatives in the field. It is with the purpose of synthesising and clarifying this diverse body of international, regional and national law – and of indicating trends and areas of concern – that this extraordinary collection of expert essays has been compiled. The authors, working in many different parts of the world, are all in some way affiliated with the International Institute of Air and Space Law at Leiden University as either alumni, faculty members or students. With details of developments affecting countries in every continent, including Antarctica, the authors delve into the ways regulation of UAS is affected by such aviation law elements as the following: – insurance; – criminal and civil liability; – role of international and supranational agencies – International Civil Aviation Organization (ICAO), European Union (EU), European Aviation Safety Agency (EASA), Association of Southeast Nations (ASEAN); – privacy and cyber security; and – civil UAS markets. Following detailed investigations of international and regional developments, the third section of the book covers a cross-section of national laws (Antarctica, Australia, Austria, Belgium, Brazil, Canada, Colombia, China, Cyprus, France, Germany, India, Indonesia, Italy, Japan, Mexico, The Netherlands, Portugal, Republic of Korea, Romania, Russian Federation, Slovenia, South Africa, Suriname, Switzerland and Liechtenstein, Turkey, United Kingdom, and United States). The authors' approaches throughout are both introductory, allowing those unfamiliar with the field to gain valuable insight into this fascinating and dynamic area, and also critical and focused, so that those more involved in the legal dimension of aviation law can further their knowledge. Without a doubt this work enriches the legal literature and encourages stakeholders in this burgeoning field of aviation law to further examine and challenge developments and trends in regulation and of practice. Lawyers, law firms, academics, governments, relevant governmental and non-governmental agencies, and strategic planners in the UAS industry will all welcome this ground-breaking resource.

This book is an attempt to present under one cover the current state of knowledge concerning the potential lightning effects on aircraft and that means that are available to designers and operators to protect against these effects. The impetus for writing this book springs from two sources- the increased use of nonmetallic materials in the structure of aircraft and the constant trend toward using electronic equipment to handle flight-critical control and navigation function.

When discussing the risk of introducing drones into the National Airspace System, it is necessary to consider the increase in risk to people in manned aircraft and on the ground as well as the various ways in which this new technology may reduce risk and save lives, sometimes in ways that cannot readily be accounted for with current safety assessment processes. This report examines the various ways that risk can be defined and applied to integrating these Unmanned Aircraft Systems (UAS) into the National Airspace System managed by the Federal Aviation Administration (FAA). It also identifies needs for additional research and developmental opportunities in this field.

Many industries have begun to recognize the potential support that unmanned aerial vehicles (UAVs) offer, and this is no less true for the commercial sector. Current research on this field is narrowly focused on technological development to improve the functionality of delivery and endurance of the drone delivery in logistics, as well as on regulatory challenges posed by such operations. There is a need for further attention to be applied to operational and integration challenges associated with UAVs. *Unmanned Aerial Vehicles in Civilian Logistics and Supply Chain Management* is a collection of innovative research that investigates the opportunities and challenges for the use of UAVs in logistics and supply chain management with a specific aim to focus on the multifaceted impact of drone delivery. While highlighting topics including non-military operations, public management,

and safety culture, this book is ideally designed for government administrators, managers, industry professionals, researchers, and students.
