Creating and Using Psychological Tests

Cambridge University Press

As a mental health clinician, you know that every client is unique, and a client's symptoms are the result of a complex combination of psychological, environmental, genetic, and neural factors. However, the de facto DSM model poses considerable constraints on how you can treat clients—often resulting in a one-size-fits-all diagnosis. This important volume challenges the assumptions and approach made by the DSM, and provides a vision and plan for an evidence-based, process-based approach to individualized care. With contributions from renowned experts in the field—including Steven C. Hayes, Stefan G. Hofmann, Joseph Ciarrochi, Matthew McKay, Uma Vaidyanathan, Sarah Morris, David Sommers, J. Scott

Fraser, and many more—this groundbreaking book will show you a new way to recognize the complexity of human suffering and human prosperity. You'll find solid tips for treating a wide variety of psychological issues in a more flexible way. And, finally, you'll come away with a greater understanding of the “processes of change,” and how to build a solid foundation for an alternative to syndromal diagnosis. The future of mental health treatment is process-based. Whether you're a clinician, researcher, student, instructor, or other professional working in the mental health field, this breakthrough volume offers everything you need to understand process-based treatment and create a more customized and effective approach to treating clients.

**Student Workbook for  
Kaplan/Saccuzzo S Psychological  
Testing: Principles, Applications,  
and Issues, 8th** Routledge

Psychologists throughout the world are being asked to assess an increasingly diverse clientele: immigrants, refugees, second and third generations still influenced by different cultures and

languages, and indigenous peoples now moving towards the mainstream. Most are ill-equipped by training and experience to understand, assess, and subsequently treat such clients competently and ethically. Virtually all agree on the need for culture-sensitive assessment, but it has proven difficult to provide adequate services, despite good intentions and funding. Too often, clients who may have different worldview and health-illness beliefs are marginalized. For many reasons, standard assessment instruments designed, researched, and normed on a few groups in the United States--the MMPI-2, the Rorschach, and the TAT--are used as though they were universally applicable. Most busy practitioners have little time to investigate alternatives developed for

use with one new group or another, focused on one issue or another, generally in a research context. In this book, Richard Dana proposes a new model of multicultural assessment practice and points directions for future training and research. He presents general, culture-specific, and step-by-step instrument-specific guidelines for the use of the standard armamentarium with different groups. Throughout, he highlights exciting new interpretive possibilities the traditional tests offer that should be regularly exploited, but emphasizes the importance of recognizing psychometric limits. Four extended examples of the use of one or several instruments with a specific group offer concrete illustrations of the model in action. Multicultural Assessment:

Principles, Applications, and Examples constitutes an invaluable new resource for psychologists and for their students and trainees.
