"The risk of engine failure is greatest when your engine is young, NOT when it's old. You should worry more about pediatrics than geriatrics." -Mike Busch A&P/IA Mike Busch on Engines expands the iconoclastic philosophy of his groundbreaking first book Manifesto to the design, operation, condition monitoring, maintenance and troubleshooting of piston aircraft engines. Busch begins with the history and theory of four-stroke spark-ignition engines. He describes the construction of both the "top end" (cylinders) and "bottom end" (inside the case), and functioning of key systems (lubrication, ignition, carburetion, fuel injection, turbocharging). He reviews modern engine leaning technique (which your POH probably has all wrong), and provides a detailed blueprint for maximizing the life of your engine. The second half presents a 21st-century approach to health assessment, maintenance, overhaul and troubleshooting. Busch explains how modern condition monitoring tools-like borescopy, oil analysis and digital engine monitor data analysis-allow you to extend engine life and overhaul strictly on-condition rather at an arbitrary TBO. The section devoted to troubleshooting problems like rough running, high oil consumption, temperamental ignition and turbocharging issues is worth its weight in gold. If you want your engine to live long and prosper, you need this book.

The major objective of this book was to identify issues related to the introduction of new materials and the effects that advanced materials will have on the durability and technical risk of future civil aircraft throughout their service life. The committee investigated the new materials and structural concepts that are likely to be incorporated into next generation commercial aircraft and the factors influencing application decisions. Based on these predictions, the committee attempted to identify the design, characterization, monitoring, and maintenance issues that are critical for the introduction of advanced materials and structural concepts into future aircraft.

The book documents the history, experiences and hardships of an intrepid aircraft engineer in salvaging damaged aircraft in the wilderness of Northern Canada. It describes the difficult and hazardous situations demanding ingenuity, resourcefulness and a lot of difficult hard work. Within the book covers are the stories of the retrievals, temporary repairs and rescues of aircraft from Artic, Tundra, remote areas of Western Canada, lake bottoms, glaciers and trees. It shows the nature of the nothern people, their willingness to provide and unreservedly to help in order to finish the job successfully. Denny's over 50 years experience in the aviation field demonstrates a lesser known side of aviation that is from the engineers' and accident investigators' perspective. This book is the first of its' kind and once started, compels the reader to continue to the last page.

Most sixteen year-old kids joyride in Daddy's pickup. Not Brian Thomas. Instead, you find him out buzzing the football team in Daddy's airplane. Flying is his life—it's in his blood. Both of his parents are pilots. His older brother is in the Air Force. And he can't imagine himself as anything but an aviator. That is, until the bleeding disorder he's battled since he was two years old sidelines him. After several failed chemotherapy treatments, Brian opts for a potentially disease-curing, but risky spleen removal. After more chemotherapy, he regains his flight status, but now he's left with an altered immune system. In April of 2009, Brian leaves his job at Duncan Aviation, where he is an aviation mechanic, to go home with what he thinks is the flu. Four hours later, he is comatose and on life-support. His hands, feet, and face develop gangrene. Ten days later when he wakes up, he must face the prospect of becoming a quadruple amputee. Surgeons save his left hand, but he faces a long road to recovery, and regaining his life.

Aviation's evolution could not have flourished without the technical support provided by thousands of men, and now women, who have gone before and are still to come. They have transcended the generic title of 'mechanic' and matured into truly masterful technicians. My Left Mag' is Out is not intended as a primer of aircraft and engine maintenance. The work will publicize to the flying public that there is life beyond the passenger gates and airport ramps where skilled technicians support aircrafts and arouse memories of incidents in the careers of other maintenance technicians. The author's maintenance career began when two biplanes chased two frightened boys across a field into the shelter of trees, seven years after Lindbergh's flight to Paris. His goal to be in aviation continues through the thirties and his enlistment in the Air Corps, where the airplanes were. Scrubbing engine parts in a cleaning shed, overhauling engines and maintaining aircraft; the attack on Pearl Harbor and the war years; post-war work at maintaining transports on the Korean Airlift followed by years of maintenance on aircrafts used for various purposes; private flying, commercial transports, research and corporate use. Finally, in structural engineering and consultant. The author was also a commercial pilot. My Left Mag' is Out has appeal to all who are interested in aviation, now, or have been, involved or are contemplating a career in aviation. *SPECIAL OFFER* send Earle a proof of purchase of his book My Left Mag' Is Out and you will receive an Aviation Maintenance Technician Log for the cost of mailing (actual value is \$14.95).

In this comprehensive aviation manual, Raoul Castro provides a source of invaluable corporate aviation management information. He begins by giving an overview of corporate aviation from its inception, then focuses on the management principles and functions that specifically target corporate aviation. Through the utilization of these sound management principles, Castro facilitates the acceptance of corporate aircraft as indispensable tools of industry. As Castro notes, few companies know how to use corporate aircraft to maximum advantage. Drawing on his expertise and experience, Castro designs a plan by which a company can achieve maximum utilization of an airplane or helicopter fleet. He gives specific instructions on how to facilitate the efficient use of the aviation department of a company, select appropriate aircraft, plan for disasters and establish security measures, fulfill legal requirements of the governmental agencies that regulate the use of aircraft, and manage the maintenance and repair of aircraft. Castro also discusses the scores of details involved in the management of a professional corporate aviation branch and how these details can be handled in a positive, productive manner. After thoroughly examining the overall managerial functions involved in planning, organizing, controlling, and implementing an aviation arm, Castro concludes by discussing the future of corporate aviation. This book is a practical and valuable guide for the executive in charge of an aviation department, an aviation department manager or chief pilot, aspirants to aviation management positions, and both students and teachers of aviation management.
