*A Manual of Surgery, for
Students and Physicians
Elsevier Science Limited
The EAES Manual of
Endoscopic Surgery
provides surgeons and
surgical residents with the*

best practical knowledge currently available on commonly performed minimally invasive abdominal and thoracic procedures. Expert European surgeons share their career-long experience by dissecting

operative procedures step by step and highlighting potential technical and anatomical hazards. Authors instruct the reader in a fashion similar to the conversations that take place between master surgeons and their apprentices while scrubbing for surgery. Uniform full color illustrations complete the detailed descriptions of minimally invasive surgeries. In addition to the operative instructions, a key component of the manual is the provision of information on patient

selection, choice of operative approach, special needs for minimally invasive procedures, and the early diagnosis and treatment of complications after surgery.
Practical Manual for Laparoscopic & Hysteroscopic Gynecological Surgery
Little, Brown Medical Division
A practical surgical manual providing a step-by-step guide to basic microsurgical techniques for the reconstruction of small vessels, nerves, and

vas deferens. This also includes access to videos demonstrating core microsurgical techniques. Incorporating 40 years of experience gained by the teachers of the microvascular course at Northwick Park, the techniques described in this manual have trained generations of surgeons. Fully illustrated and with a clear, succinct text, this manual will enable the reader to master basic skills quickly and confidently. Microsurgery is not difficult, provided it is taught properly: There

is no magic formula, but it must be learnt slowly, patiently and step by step. This valuable resource will be useful for surgeons in training and in practice and for research workers who are increasingly using microsurgical techniques in their experiments.

Manual of Ambulatory General Surgery CRC Press

In the past few years spine surgery has undergone revolutionary changes leading towards minimally invasive techniques. This book is a

survey of microsurgical as well as endoscopic surgical techniques for the treatment of a variety of spinal disorders. The structure of the individual chapters includes terminology, history, surgical principles, advantages/disadvantages, indications, surgical technique, complications and hazards as well as results. However all chapters are focused on a very didactic presentation of surgical steps. Thus, the reader will get familiar with a variety of new techniques some of which

are already integrated into clinical routine others still being part of ongoing clinical trials and development.

The second SAGES (Society of American Gastrointestinal Endoscopic Surgeons) manual was intended to be a companion piece for the successful first SAGES manual, edited by Carol Scott-Connor, that was published more than 4 years ago. Originally, the goal was to concentrate on tersely covered or often ignored aspects of the preoperative preparation of the patient and the operating room as well as the postoperative care of patients

undergoing minimally invasive operations. It was also our intention to include a section for each procedure where several different port placement schemes would be presented and briefly discussed. Unique to this manual, the impact of the patient's body habitus (short or long, narrow or wide) on port placement is also taken into account for many of the procedures. Also unique are chapters devoted to hypothermia, port wound closure, and the management of

subcutaneous emphysema and abdominal wall hemorrhage caused by trocars. Naturally, the surgeon tends to focus on the technical aspects of the procedure, such as the operative tasks to be carried out, the order of operation, and the position of the surgeon and assistant. However, it is critical that the surgeon be aware that the CO₂ pneumoperitoneum, far more so than laparotomy, results in multiple physiologic alterations that, if not compensated

for by the anesthesiologist and surgeon, may endanger the patient or prevent the laparoscopic completion of the procedure.
