Plant Diversity I: Bryophytes and Seedless Vascular Plants As mentioned earlier, bryophytes are a group of plants that are non-vascular and don't have seeds. If they don't have seeds, how do new plants grow? Instead of seeds, bryophytes have spores. Spores are single cells that produce all the genetic information and capability to grow into a new plant. Compared to water, land is an erratic habitat where temperature and moisture availability may change abruptly and dramatically. Diversity in the Plant Kingdom I. Introduction Bryophyte, traditional name for any nonvascular seedless plant—namely, any of the mosses (division Bryophyta), hornworts (division Anthocerotophyta), and liverworts (division Marchantiophyta). Most bryophytes lack complex tissue organization, yet they show considerable diversity in form and ecology. They are widely distributed throughout the world and are relatively small compared with most seed-bearing plants.
