Are we in
imminent
danger of
extinction?
Yes, we
probably are,
argues John

Leslie in his
chilling
account of the
dangers facing
the human
race as we
approach the
second
millennium. The
End of the

World is a sobering assessment of the many disasters that scientists have predicted and speculated on as leading to apocalypse. In the first comprehensive survey, potential catastrophes - ranging from deadly diseases to high-energy physics experiments - are explored to help us understand the risks. One of the greatest threats facing humankind, however, is the insurmountable

fact that we are a relatively young species, a risk which is at the heart of the 'Doomsday Argument'. This argument, if correct, makes the dangers we face more serious than we could have ever imagined. This more than anything makes the arrogance and ignorance of politicians, and indeed philosophers, so disturbing as they continue to ignore the manifest

dangers facing future generations. An Ultralow Temperature Phenomenon Springer Science & Business Media

Featuring a new author team, this seminal book has been completely updated and significantly expanded. Following an outline of the basic elements of ophthalmic science relevant to study and practice, the authors

provide a detailed description and discussion of each condition including etiology, clinical signs, diagnosis, prognosis, and therapy, as well as a section dedicated to presumed inherited eye disorders. The focus throughout remains on the clinical needs of the practitioner and the student. Beautifully illustrated in full color, the book is aimed at trainee and practicing

veterinarians interested in all types of ophthalmic diseases and disorders. Although the focus is on small animals, there is additional material on the horse and the cow. For this edition, a diverse group of authors from many geographic regions of training and practice offer a breadth of clinical expertise. Physics of Cryogenics: An Ultralow Temperature Phenomenon discusses the significant number of advances that have been made during the last few years in a variety of cryocoolers, such as Brayton, Joule-Thomson, Stirling, pulse tube, Gifford-McMahon and magnetic refrigerators. The book reviews various approaches taken to improve reliability, a major driving

force for new research areas. The advantages and disadvantages of different cycles are compared, and the latest improvements in each of these cryocoolers is discussed. The book starts with the thermodynamic fundamentals, followed by the definition of cryogenic and the associated science behind low temperature phenomena and properties. This book is

an ideal resource for scientists, engineers and graduate and senior undergraduate students who need a better understanding of the science of cryogenics and related thermodynamics. Defines the fundamentals of thermodynamics that are associated with cryogenic processes Provides an overview of the development of cryogenic technology Includes new,

low temperature tables written by the author Deals with the application of cryogenics to preserve objects at very low temperature Explains how cryogenic phenomena work for human cell and human body preservations and new medical approaches

 Approximately three percent

of newborn humans have congenital anomalies with significant cosmetic and/or functional consequences . Much of our ability to understand what has gone awry in these birth defects rests with development of animal models for them; the mouse has emerged as the model organism of choice for these studies. This volume reviews mouse models of specific developmental genetic diseases, including neural tube defects; cleft lip and/or palate; congenital heart disease; ciliopathies; hereditary deafness and others to provide conceptual insight into congenital anomalies generally. The interplay between clinical observation and murine model systems is expected to yield deep insight into mammalian developmental processes and the emergence of effective preventive and/or therapeutic strategies. * Provides busy clinical and basic science researchers a one-stop overview and synthesis of the latest research findings and contemporary thought in the area * Allows researchers to compare and contrast disease models and also to learn about what models have been developed for large-scale distribution *

Allows researchers to evaluate basic differences in mouse and human biology and propose alternate pathways and possible gene interactions of the disease

 Head formation requires the well-orchestrated and harmonised development of various tissues and organs within the

craniofacial complex. A big variety of signaling pathways are involved in this process by controlling cell proliferation, migration, differentiation, tissue morphogenesis, homeostasis and regeneration. Deregulation and malfunction of these signaling molecules may lead to mild or severe craniofacial pathologies. This eBook is a collection of articles dealing with a

variety of important signals involved in the control of developmental and pathological events of craniofacial organs and tissues. These recent advances show the importance of signaling pathways in craniofacial physiology and pathology and generate important new knowledge aiming the development of new pharmaceutical products that mimic and/or block the actions of

specific molecules.

This textbook provides a practically applicable resource for understanding the surgical oncology management of pancreatic cancer. It discusses relevant aspects of anatomy and pathophysiology along with the latest diagnostic techniques. Insightful descriptions are then provided detailing how to perform

critical surgical procedures when treating these patients. Relevant perioperative management strategies and emerging themes in cancer biology critical to understanding and treating the disease are also described. The need for cross-discipline collaboration to facilitate and enhance innovation within the discipline is reinforced throughout the text. Each chapter

presents the relevant current clinical standards along with areas of controversy in both research and clinical practice within “pearls and pitfalls” sections. Textbook of Pancreatic Cancer: Principles and Practice of Surgical Oncology is a detailed work covering the basic material important to trainees as well as advanced curriculum for established specialists in the field from a multi-

disciplinary perspective. Therefore, it is crucial resource for all practicing and trainee professionals who encounter these patients in their day-to-day clinical practice.

Volume XV
"Urology in Childhood" was written in 1956/57 and was the first in the series of the Encyclopedia of Urology to appear. This present volume has been constructed as a supplement and the original intention was to deal only with those subjects in which there have been significant advances during the intervening sixteen years. As the work has proceeded, however, it has become

evident that there is no aspect of paediatric urology which has not been developed, and no topic which has not been illuminated by many contributions to the literature. Indeed, there has been such a copious flow of publications devoted to children's urinary tract disease that a full review is no longer possible within the compass of a volume of this size: the decision as to what should be left out has

therefore been a matter of the greatest difficulty. The choice has been inevitably arbitrary and many omissions are regretted. The attempt has been made, however, to report the most notable developments of the subject, and perhaps the greatest change in the practice of paediatric urology has been the full integration with paediatric nephrology. The team approach to infant disease in particular

has led to greatly improved results. I have been fortunate to have Dr. T. M. **Development of High-emittance Scales on Thoriated Nickel-chromium-aluminum-base Alloys** "Neutrinos in Particle Physics, Astronomy and Cosmology" provides a comprehensive and up-to-date introduction to neutrino physics, neutrino astronomy and neutrino

cosmology. The intrinsic properties and fundamental interactions of neutrinos are described, as is the phenomenology of lepton flavor mixing, seesaw mechanisms and neutrino oscillations. The cosmic neutrino background, stellar neutrinos, supernova neutrinos and ultrahigh-energy cosmic neutrinos, together with the cosmological matter-antimatter asymmetry and other

roles of massive neutrinos in cosmology, are discussed in detail. This book is intended for researchers and graduate students in the fields of particle physics, particle astrophysics and cosmology.
