Taking an integrated approach to the biology of marine carnivores, cetaceans, and sirenians, twenty-two prominent researchers compare marine mammals with one another and with terrestrial mammals, providing a framework for fundamental biological and ecological concepts. They describe functional morphology, sensory systems, energetics, reproduction, communication and cognition, behavior, distribution, population biology, and feeding ecology. They also detail the physiological adaptations—for such activities and processes as diving, thermo-regulation, osmoregulation, and orientation—that enable marine mammals to exploit their aquatic environment.

In planning The Handbook volumes on Audition, we, the editors, made the decision that there should be many authors, each writing about the work in the field that he knew best through his own research, rather than a few authors who would review areas of research with which they lacked first hand familiarity. For the purposes of the chapters on Audition, sensory physiology has been defined very broadly to include studies from the many disciplines that contribute to our understanding of the structures concerned with hearing and the processes that take place in these structures in man and in lower animals. A number of chapters on special topics have been included in order to present information that might not be covered by the usual chapters dealing with anatomical, physiological and behavioral aspects of hearing. We wish to thank all authors of the volumes on Audition for the contributions that they have made. We feel confident that their efforts will also be appreciated by the

many scientists and clinicians who will make use of the Handbook for many years to come. WOLF D. KEIDEL WILLIAM D. NEFF Erlangen Bloomington August 1974 Contents Introduction. By G. v. BEKESY t.
