Testing and Assessment in Translation and Interpreting Studies examines issues of measurement that are essential to translation and interpreting. Conceptualizing testing both as a process and a product, the collection of papers explores these issues across languages and settings (including university classrooms, research projects, the private sector, and professional associations). The authors have approached their chapters from different perspectives using a variety of methods, some focusing on very specific variables, and others providing a much broader overview of the issues at hand. Chapters range from a discussion of the measurement of text cohesion in translation; the measurement of interactional competence in interpreting; the use of a particular scale to measure interpreters' renditions to the application of a specific approach to grading or general program assessment (such as interpreter or translator certification at the national level or program admissions processes). These studies point to the need for greater integration of research and practice in the specific area of testing and assessment and are a welcome addition to the field.

The purpose of this volume is to present a snapshot of the state of the art of research on the languages of the Maltese islands, which include spoken Maltese, Maltese English and Maltese Sign

Language. Malta is a tiny, but densely populated country, with over 422,000 inhabitants spread over only 316 square kilometers. It is a bilingual country, with Maltese and English enjoying the status of official languages. Maltese is a descendant of Arabic, but due to the history of the island, it has borrowed extensively from Sicilian, Italian and English. Furthermore, local dialects still coexist alongside the official standard language. The status of English as a second language dates back to British colonial rule, and just as in other former British colonies, a characteristic Maltese variety of English has developed. To these languages must be added Maltese Sign Language, which is the language of the Maltese Deaf community. This was recently recognised as Malta's third official language by an act of Parliament in 2016. While a volume such as the present one can hardly do justice to all aspects of a diverse and complex linguistic situation, even in a small community like that of Malta, our aim in editing this book was to shed light on the main strands of research being undertaken in the Maltese linguistic context. Six of the contributions in this book focus on Maltese and explore a broad range of topics including: historical changes in the Maltese sound system; syllabification strategies; the interaction of prosody and gesture; the constraints regulating /t/-insertion; the productivity of derivational suffixes; and raising phenomena. The study of Maltese English, especially with the purpose of establishing the defining characteristics of this variety of English, is a relatively new area of research. Three of the papers in this volume deal with Maltese English, which is explored from the different perspectives of rhythm, the syntax of nominal phrases, and lexical choice. The last contribution discusses the way in which Maltese Sign Language (LSM) has evolved alongside developments in LSM research. In summary, we believe the present volume has the potential to present a unique snapshot of a complex linguistic situation in a geographically restricted area. Given the nature and range of topics proposed, the volume will likely be of interest to researchers in both theoretical and comparative linguistics, as well as those working with experimental and corpus-based methodologies. Our hope is that the studies presented here will also serve to pave the way for further research on the languages of Malta, encouraging researchers to also take new directions, including the exploration of variation and sociolinguistic factors which, while often raised as explanatory constructs in the papers presented here, remain under-researched.

The theme of the conference this year was Critical CALL, drawing inspiration from the work carried out in the broader field of Critical Applied Linguistics. The term 'critical' has many possible interpretations, and as Pennycook (2001) outlines, has many concerns. It was from these that we decided on the conference theme, in particular the notion that we should question the assumptions that lie at the basis of our praxis, ideas that have become 'naturalized' and are not called into question. Over 200 presentations were delivered in 68 different sessions, both in English and Italian, on topics related specifically to the theme and also more general CALL topics. 94 of these were submitted as extended papers and appear in this volume of proceedings.

Lexical Priming proposes a radical new theory of the lexicon, which amounts to a completely new theory of language based on how words are used in the real world. Here they are not confined to the definitions given to them in dictionaries but instead interact with other words in common patterns of use. Using concrete statistical evidence from a corpus of newspaper English, but also referring to travel writing and literary text, the author argues that words are 'primed' for use through our experience with them, so that everything we know about a word is a product of our encounters with it. This knowledge explains how speakers of a language succeed in being fluent, creative and natural.

Theory, Analysis, and Applications John Benjamins Publishing

This book presents a modern introduction to analytical and numerical techniques for solving ordinary differential equations (ODEs). Contrary to the traditional format—the theorem-and-proof format—the book is focusing on analytical and numerical methods. The book supplies a variety of problems and examples, ranging from the elementary to the advanced level, to introduce and study the mathematics of ODEs. The analytical part of the book deals with solution techniques for scalar first-order and second-order linear ODEs, and systems of linear ODEs—with a special focus on the Laplace transform, operator techniques and power series solutions. In the numerical part, theoretical and practical aspects of Runge-Kutta methods for solving initial-value problems and shooting methods for linear two-point boundary-value problems are considered. The book is intended as a primary text for courses on the theory of ODEs and numerical treatment of ODEs for advanced undergraduate and early graduate students. It is assumed that the reader has a basic grasp of elementary calculus, in particular methods of integration, and of numerical analysis. Physicists, chemists, biologists, computer scientists and engineers whose work involves solving ODEs will also find the book useful as a reference work and tool for independent study. The book has been prepared within the framework of a German–Iranian research project on mathematical methods for ODEs, which was started in early 2012.

Formulaic sequences (FS) are now recognized as an essential element of language use. However, research on FS has generally been limited to a focus on description, or on the place of FS in L1 acquisition. This volume opens new directions in FS research, concentrating on how FS are acquired and processed by the mind, both in the L1 and L2. The ten original studies in the volume illustrate the L2 acquisition of FS, the relationship between L1 and L2 FS, the relationship between corpus recurrence of FS and their psycholinguistic reality, the processes involved in reading FS, and pedagogical issues in teaching FS. The studies use a wide range of methodologies, many of them innovative, and thus the volume serves as a model for future research in the area. The volume begins with three survey chapters offering a background on the characteristics and measurement of FS.

Delay, difference, functional, fractional, and partial differential equations have many applications in science and engineering. In this Special Issue, 29 experts co-authored 10 papers dealing with these subjects. A summary of the main points of these papers follows: Several oscillation conditions for a first-order linear differential equation with non-monotone delay are established in Oscillation Criteria for First Order Differential Equations with Non-Monotone Delays, whereas a sharp oscillation criterion using the notion of slowly varying functions is established in A Sharp Oscillation Criterion for a Linear Differential Equation with Variable Delay. The approximation of a linear autonomous differential equation with a small delay is considered in Approximation of a Linear Autonomous Differential Equation with Small Delay; the model of infection diseases by Marchuk is studied in Around the Model of Infection Disease: The Cauchy Matrix and Its Properties. Exact solutions to fractional-order Fokker-Planck equations are presented in New Exact Solutions and Conservation Laws to the Fractional-Order Fokker-Planck Equations, and a spectral collocation approach to solving a class of time-fractional stochastic heat equations driven by Brownian motion is constructed in A Collocation Approach for Solving Time-Fractional Stochastic Heat Equation Driven by an Additive Noise. A finite difference approximation method for a space fractional convection-diffusion model with variable coefficients is proposed in Finite Difference Approximation

Method for a Space Fractional Convection-Diffusion Equation with Variable Coefficients; existence results for a nonlinear fractional difference equation with delay and impulses are established in On Nonlinear Fractional Difference Equation with Delay and Impulses. A complete Noether symmetry analysis of a generalized coupled Lane-Emden-Klein-Gordon-Fock system with central symmetry is provided in Oscillation Criteria for First Order Differential Equations with Non-Monotone Delays, and new soliton solutions of a fractional Jaulent soliton Miodek system via symmetry analysis are presented in New Soliton Solutions of Fractional Jaulent-Miodek System with Symmetry Analysis.

Designed to help lexicographers compile better dictionaries of English, this book provides information about the language that is not available in any other single source. It is the first serious attempt to describe in detail the lexical and grammatical differences between American and British English and offers a trailblazing solution to the vexing problem of how to treat General American and British RP pronunciation in the same dictionary with the help of a Simplified Transcription for which any typewriter keyboard can be adapted and a pioneering description of the principles concerning the treatment of fixed grammatical and lexical collocations in future general-purpose dictionaries of English.

Collocations are both pervasive in language and difficult for language learners, even at an advanced level. In this book, these difficulties are for the first time comprehensively investigated. On the basis of a learner corpus, idiosyncratic collocation use by learners is uncovered, the building material of learner collocations examined, and the factors that contribute to the difficulty of certain groups of collocations identified. An extensive discussion of the implications of the results for the foreign language classroom is also presented, and the contentious issue of the relation of corpus linguistic research and language teaching is thus extended to learner corpus analysis.
