It either holds the values of the controlled quantities constant or causes them to vary in a prescribed way. A control system may be operated by electricity, by mechanical means, by fluid pressure (liquid or gas), or by a combination of means. [Control system | technology | Britannica](#) A control system is a type of computer system that manages, commands and directs other devices or systems. There are open and closed loop control systems. They usually take an input,

process it and get an output. Control Systems - Computer Science Wiki
 A control system is a type of system that controls the output in order to provide the desired response. It is a group of either electronic or mechanical devices which utilise control loops in order to control other systems or devices. Control systems are automated with the use of computers. It is a vital part of the automation industry.

 Systems Science & Control Engineering: Vol 8, No 1
 Control systems in which the output has an effect upon the input quantity in order to maintain the desired output value are called closed loop systems. The open loop system can be modified as closed loop system by providing a feedback. The provision of feedback automatically corrects the changes in output due to disturbances. Hence the closed loop system is also called automatic control system. The general block diagram of an automatic control system is shown in the figure below. It consists of ...

 Control theory, field of applied mathematics that is relevant to the control of certain physical processes and systems. Although control theory has deep connections with classical areas of mathematics, such as the calculus of variations and the theory of differential equations, it did not become a field in its own right until the late 1950s and early 1960s.
