 We can simplify this function in two methods. Method 1. Given Boolean function, $f = p'qr + pq'r + pqr' + pqr$. Step 1 – In first and second terms r is common and in third and fourth terms pq is common. So, take the common terms by using Distributive law. \Rightarrow

$$f = (p'q + pq')r + pq(r' + r)$$

 The basic procedure for solving a circuit using Thevenin's Theorem is as follows: 1. Remove the load resistor R L or component concerned. 2. Find R S by shorting all voltage sources or by open circuiting all the current sources. 3. Find V S by the usual circuit analysis

Electric circuit theorems are always beneficial to help find voltage and currents in multi-loop circuits. These theorems use fundamental rules or formulas and basic equations of mathematics to analyze basic components of electrical or electronics parameters such as voltages, currents, resistance, and so on. These fundamental theorems include the basic theorems like Superposition theorem, Tellegen's theorem, Norton's theorem, Maximum power transfer theorem, and Thevenin's theorems.
