Cities in Sub-Saharan Africa are experiencing rapid population growth. Yet their economic growth has not kept pace. Why? One factor might be low capital investment, due in part to Africa's relative poverty: Other regions have reached similar stages of urbanization at higher per capita GDP. This study, however, identifies a deeper reason: African cities are closed to the world. Compared with other developing cities, cities in Africa produce few goods and services for trade on regional and international markets To grow economically as they are growing in size, Africa's cities must open their doors to the world. They need to specialize in manufacturing, along with other regionally and globally tradable goods and services. And to attract global investment in tradable production, cities must develop scale economies, which are associated with successful urban economic development in other regions. Such scale economies can arise in Africa, and they will—if city and country leaders make concerted efforts to bring agglomeration effects to urban areas. Today, potential urban investors and entrepreneurs look at Africa and see crowded, disconnected, and costly cities. Such cities inspire low expectations for the scale of urban production and for returns on invested capital. How can these cities become economically dense—not merely crowded? How can they acquire efficient connections? And how can they draw firms and skilled workers with a more affordable, livable urban environment? From a policy standpoint, the answer must be to address the structural problems affecting African cities. Foremost among these problems are institutional and regulatory constraints that misallocate land and labor, fragment physical development, and limit productivity. As long as African cities lack functioning land markets and regulations and early, coordinated infrastructure investments, they will remain local cities: closed to regional and global markets, trapped into producing only locally traded goods and services, and limited in their economic growth.

"The authors study the effect of financial crises on trade credit in a sample of 890 firms in six emerging economies. They find that although provision of trade credit increases right after the crisis, it consequently collapses in the following months and years. The authors observe that firms with weaker financial position (for example, high pre-crisis level of short-term debt and low cash stocks and cash flows) are more likely to reduce trade credit provided to their customers. This suggests that the decline in aggregate credit provision is driven by the reduction in the supply of trade credit, which follows the bank credit crunch. The results are consistent with the "redistribution view" of trade credit provision, in which bank credit is redistributed by way of trade credit by the firms with stronger financial position to the firms with weaker financial stand"—World Bank web site. *Handbook of Research on Strategic Business Infrastructure Development and Contemporary Issues in Finance* Springer

Essay from the year 2017 in the subject Business economics - Investment and Finance, grade: 5.50, Anglia Ruskin University, language: English, abstract: This report addresses a paradox: high profit and at the same time significant debts for the company. Seen from this perspective, the profit regarded as the difference between the total revenue and the total costs and the cash flow seen as the incomings and outgoing of cash of a particular company is somehow different. One of the reasons for that is the usage of the accounting conventions of the accruals; however the issues relating to the working capital management are also of importance. In this field of development, the way changes in the working capital affect cash flow will be analyzed and important recommendations will be made.
