In his new book, Steve Jones takes on the challenge of going back to the book of the millennium, Charles Darwin's "On the Origin of Species, and updating it with the latest scientific findings. Before Darwin's pivotal book, biology was a set of unconnected facts. Darwin made it into a science, linked by the theory of evolution, the grammar of the living world. Evolution reveals ties between cancer and the genetics of fish, between brewing beer and inheriting disease, between the sex lives of crocodiles and the politics of Brazil. Darwin used the biology of the nineteenth century to prove his case. Now, that

science has been revolutionized and his case can be reargued using the twentieth century's astonishing advances. Filled with anecdotes, humour and the latest research, "Darwin's Ghost is a popular account of the science that makes life make sense.

2004-2005 NSTA Press

The compartmentation of genetic information is a fundamental feature of the eukaryotic cell. The metabolic capacity of a eukaryotic (plant) cell and the steps leading to it are overwhelmingly an endeavour of a joint genetic cooperation between nucleus/cytosol, plastids, and mitochondria. Alter ation of the genetic material in anyone of these compartments or exchange of organelles between species can seriously affect harmoniously balanced growth of an organism. Although the biological significance of this genetic design has been vividly evident since the discovery of non-Mendelian inheritance by Baur and Correns at the beginning of this century, and became indisputable in principle after Renner's work on interspecific nuclear/plastid hybrids (summarized in his classical article in 1934), studies on the genetics of organelles have long suffered from the lack of respectabil ity. Non-Mendelian inheritance was considered a research sideline~ifnot a freak~by most geneticists, which becomes evident when

one consults common textbooks. For instance, these have usually impeccable accounts of photosynthetic and respiratory energy conversion in chloroplasts and mitochondria, of metabolism and global circulation of the biological key elements C, N, and S, as well as of the organization, maintenance, and function of nuclear genetic information. In contrast, the heredity and molecular biology of organelles are generally treated as an adjunct, and neither goes as far as to describe the impact of the integrated genetic system.
