Why are so many people attracted to narrative fiction? How do authors in this genre reframe experiences, people, and environments anchored to the real world without duplicating "real life"? In which ways does fiction differ from reality? What might fictional narrative and reality have in common—if anything? By analyzing novels such as Arundhati Roy's *The God of Small Things*, Amitav Ghosh's *The Glass Palace*, Zadie Smith's *White Teeth*, and Hari Kunzru's *The Impressionist*, along with selected Latino comic books and short fiction, this book explores the peculiarities of the production and reception of postcolonial and Latino borderland fiction. Frederick Luis Aldama uses tools from disciplines such as film studies and cognitive science that allow the reader to establish how a fictional narrative is built, how it functions, and how it defines the boundaries of concepts that appear susceptible to limitless interpretations. Aldama emphasizes how postcolonial and Latino borderland narrative fiction authors and artists use narrative devices to create their aesthetic blueprints in ways that loosely guide their readers' imagination and emotion. In *A User's Guide to Postcolonial and Latino Borderland Fiction*, he argues that the study of ethnic-identified narrative fiction must acknowledge its active engagement with world narrative fictional genres, storytelling modes, and techniques, as well as the way such fictions work to move their audiences.

Learn to create and use simulation models—the most reliable and cost-effective tools for predicting real-world results! The Handbook of Processes and Modeling in the Soil-Plant System is the first book to present a holistic view of the processes within the soil-plant-atmosphere continuum. Unlike other publications, which tend to be more specialized, this book covers nearly all of the processes in the soil-plant system, including the fundamental processes of soil formation, degradation, and the dynamics of water and matter. It also illustrates how simulation modeling can be used to understand and forecast multiple interactions among various processes and predict their environmental impact. This unique volume assembles information that until now was scattered among journals, bulletins, reports, and symposia proceedings to present models that simulate almost all of the processes occurring in the soil-plant system and explores the results that these models are capable of producing. With chapters authored by experts with years of research and teaching experience, the Handbook of Processes and Modeling in the Soil-Plant System examines: physical, chemical, and biological soil processes the soil formation and weathering process and its modeling the impact of radioactive fallout on the soil-plant system soil degradation processes and ways to control them water and matter dynamics in the soil-plant system growth and development of crops at various levels of production the potentials and limitations of using simulation models Students, educators, and professionals alike will find the Handbook of Processes and Modeling in the Soil-Plant System an invaluable reference on the soil-plant-atmosphere system and an ideal tool to help develop an effective decision support system.

This review was conducted to determine the current state of the art in watershed water quality modeling. Several available watershed water quality models were reviewed and rated with regard to their potential in being utilized as the building block for the development of a Corps of Engineers watershed water quality model. Watershed water quality models are currently being implemented for predicting watershed runoff water quality as influenced by land use change, development, watershed improvement strategies, best management practices, and in the determination of total daily maiiimum loads. The model selected as a building block for the Corps of Engineers model will be implemented into the U.S. Army Engineer Waterways Experiment Station's Watershed Modeling System (WMS). The WMS can be used currently in the application of watershed models for both preprocessing and postprocessing. Current models contained in the WMS do not have water quality capabilities. Thus, the implementation of the selected watershed water quality model into the system will extend the capabilities of the system to include watershed water quality modeling.
