In pathology education within North America, there exists a wide gap in the pedagogy between medical school and residency. As a result, the pathology intern often comes into residency unprepared. Completely illustrated in color, this book lays the foundation of practical pathology and provides a scaffold on which to build a knowledge base. It includes basic introductory material and progresses through each organ system. Within each chapter, there is a brief review of salient normal histology, a discussion of typical specimen types, a strategic approach to the specimen, and a discussion of how the multitude of different diagnoses

relate to each other.

"This new edition also brings quite a few new authors and their fresh perspectives, sadly necessitated in several instances by the deaths of former world-class senior contributors. Those no longer with us include, Drs. Margaret Billingham, John McNeal, and Sunitha Wickramasinghe. Shortly after

submission of his chapter for this edition, my friend Dr. Bernd Scheithauer also left us"--Provided by publisher.

Gastrointestinal mucosal biopsies are an active part of the pathologist's day and have increased in the past few years as endoscopic screening has become more commonplace. This new full-color Second Edition of Biopsy Interpretation of the Gastrointestinal Tract Mucosa has been expanded into two concise, comprehensive volumes to offer more complete coverage of both non-neoplastic and neoplastic entities. Like the other books in the Biopsy Interpretation Series, these volumes are practical references for pathologists to use when making diagnostic decisions

based on biopsy specimens. Volume 2 of this Second Edition focuses on interpretation of neoplastic gastrointestinal mucosal biopsies. Coverage is geared to daily practice and includes mucosal biopsies from the esophagus, stomach, small intestine, large intestine, and anus. A companion website includes all of the 300 print illustrations plus an additional 750 e-figures. Volume 1 focuses on non-neoplastic biopsies and published in November 2011.

A strong grounding in basic histology is essential for all pathologists. However, there had always been a gap between

histology and pathology in which histologic information specifically for the pathologist was often lacking. Histology for Pathologists deals with the microscopic features of normal human tissues, from the perspective of the surgical pathologist. This is the only text that uses human (vs. animal) tissues for the histology. It is the best reference in the literature for information on normal histology, and, as such, is essential for all clinical pathologists. Written by pathologists for pathologists, the new edition updates the pathologist's understanding of normal histology up to date with the incremental advances made in the last five years. The 3rd edition has become a "classic" purchased by virtually all residents beginning their pathology training, as

well as pathologists in practice. The 4th edition builds on that substantial foundation. The table of contents remains essentially the same with the exception of some changes in authorship.

[Sternberg's Diagnostic Surgical Pathology](#) Elsevier Health Sciences This generously illustrated textbook is a simple guide to the pathologic diagnosis of 'medical' lung disease, written by an expert, subspecialty-trained pulmonary pathologist. General surgical pathologists and pathology residents will find it accessible and full of practical pearls that can be used in real-life

situations. The algorithms in this book provide a glimpse into the thought process of a subspecialist. They start with an abnormal histologic finding, and take the reader step by step to the correct diagnosis. Unlike most pathology textbooks, diseases are grouped on the basis of pathologic findings rather than etiology, mirroring the actual practice of surgical pathology. Another novel feature of this book is that it provides actual examples of pathology reports for each disease. Pathologists will find this book tremendously helpful when faced with difficult cases of interstitial lung disease or lung granulomas. It should be part of every surgical pathologist's library.

This book is a compilation of high-yield, at-a-glance summaries for various topics on which pathologists frequently need information in a quick reference format while at the microscope (or when cramming for the boards). The authors are early-career pathologists who have compiled this book from the perspective of pathologists-in-training. The focus is not organ-based histologic criteria, but rather everything else that goes into pathologic diagnoses but is difficult to keep committed to memory. The emphasis is on immunohistochemistry, special stains, grading systems, molecular markers, tumor syndromes, and helpful clinical references. The book has a unique format in that the information is presented primarily in tables and diagrams accompanied by

minimal explanatory text. It is intended to serve as a 'peripheral brain' for pathology residents and also practicing pathologists, where frequently needed information is readily accessible and easy to navigate.
