The origins of KIDO date back to 1920 and the experimental radio station 7YA at Boise High School. In 1922, chemistry teacher Harry Redeker was granted a limited-commercial license and the call letters KFAU. Redeker left the school in 1927, and in 1928, the Boise Independent School District sold KFAU to Frank L. Hill and C.G. Phillips, who changed the station's call letters to KIDO. Over the next 30 years, "Kidido" Phillips and his wife, Georgia, achieved many "firsts" in Idaho broadcasting, including securing NBC as the state's first network affiliation. In 1942, Curt G. Phillips suddenly passed away. Georgia remarried and became Georgia Davidson, going on to build KIDO-FM and KIDO-TV, which were both among the first in the state. In 1959, she sold KIDO Radio to William E. Boeing Jr. of Seattle, who owned KIDO for the next 17 years. It is this period of KIDO's rich history, from 1920 to 1976, that this book will cover. Is television dead? The classic television era of the 1950s and 1960s, characterized by limited choices of programs broadcast on over the air channels to families as if they were seated around a hearth - and to a nation as if gathered around a campfire - has indeed ended. Throughout the drastic evolution of this media, thousands of studies have examined the short-term effects of television, such as the evaluation of persuasion campaigns. Yet there is scant research on the overreaching sociological impacts of television and its centrality to Western

culture over the past 60 years. This compelling volume of *The ANNALS* is the first collection of rigorous articles devoted to studying ways in which television has impacted our values, ideologies, institutions, social structure, and culture.

The Complete Guide to Electronics Troubleshooting Delmar Pub

A Cyber-Physical Systems Approach

An introduction to the engineering principles of embedded systems, with a focus on modeling, design, and analysis of cyber-physical systems. The most visible use of computers and software is processing information for human consumption. The vast majority of computers in use, however, are much less visible. They run the engine, brakes, seatbelts, airbag, and audio system in your car. They digitally encode your voice and construct a radio signal to send it from your cell phone to a base station. They command robots on a factory floor, power generation in a power plant, processes in a chemical plant, and traffic lights in a city. These less visible computers are called embedded systems, and the software they run is called embedded software. The principal challenges in designing and analyzing embedded systems stem from their interaction with physical processes. This book takes a cyber-physical approach to embedded systems, introducing the engineering

concepts underlying embedded systems as a technology and as a subject of study. The focus is on modeling, design, and analysis of cyber-physical systems, which integrate computation, networking, and physical processes. The second edition offers two new chapters, several new exercises, and other improvements. The book can be used as

a textbook at the advanced undergraduate or introductory graduate level and as a professional reference for practicing engineers and computer scientists. Readers should have some familiarity with machine structures, computer programming, basic discrete mathematics and algorithms, and signals and systems.
